

Private Sewer Lateral Service Plan

Private Sewer Laterals are the pipes which run beneath your property that transport sewage and wastewater from your property to the City's wastewater treatment plant. Most sewer laterals were originally constructed with cast iron, and have exceeded their estimated lifespan. The resulting pollution from broken and defective laterals has leached into, and continues to pollute, Reynolds Channel. To remedy this problem, on January 22, 2014, the Long Beach City Council adopted comprehensive legislation that is designed to protect and safeguard our waters, and natural resources, for future generations. To help property owners achieve compliance with local, state, and federal laws, and to further promote the preservation of our waters, the City has partnered with Brady Risk Environmental, who will administer a repair and replacement program for the benefit of property owners. A full program description, along with terms and conditions and frequently asked questions, follows.

*****Please be sure to check the appropriate box, and then return this form within the next sixty (60) days, or you will be automatically enrolled in the program during the first year.**
